

Strawberry-substrates

C1 Very coarse soft fruit substrates, based on the hardest selected white peat. These substrates guarantee a high afp, even after several years of usage. For improved water absorption, we advise you to choose the C1 with added cocofibre.

C2 Superb quality coarse strawberry substrates for long lasting productions. Non compromising mixes that give a high afp even after long wet winters. Depending on the substrate system, you can choose the very coarse, coarse or medium C2 mix.

C3 Standard strawberry substrates for day neutrals, single and double cropping. In these substrates, different sources of white peat are blended to best suit the basic demands of a strawberry crop.

C4 Substrates for single cropping only. In these substrates different sources of white peat are blended to produce a favourably priced substrate that meets the demand of a short term crop.

C5 Coir based substrates. Ideal when the substrate is going to be reused. Due to its fine structure, this product is suitable where mechanical filling is used. Initial growth in these substrates is extremely good thanks to perfect root-substrate contact. The coir based substrates appear very fine, however, they have a very high afp figure. Coir guarantees a durable long lasting high quality substrate. Growers that want to reuse their substrate over several years might consider using a coir based substrate. All coir used is always buffered and flushed.

T Tray substrates for tips and production of tray plants.

98cm x 25cm Peat Bag
